§ SPECIFICATIONS OF THE BANKNOTE COUNTER

MODEL TC-5500 (Desktop) / TC-5500S (Floor Stand)

※ Features

- | | |
|----------------|--------------------------------------|
| 1) Check Mode | : Counting of 100 Notes Batched |
| 2) Free Mode | : Free Counting |
| 3) Preset Mode | : Counting for Batched Number |
| 4) Manual Mode | : Start Counting by Manual |
| 5) ACC Mode | : Accumulate the Total Notes Counted |

※Specification

	TC-5500 (Desktop)	TC-5500S (Floor Stand)
1) Dimensions(mm) WxDxH	374 x 374 x 260	374 x 374 x 830
2) Net Weight (kg)	25	37
3) Power Supply	110V,AC±10% 60Hz or 220V,AC±10% 50Hz	
4) Power Consumption	330W	
5) Temperature Limits in Use	10° to 40° C	
6) Counting Speed	Approx. 100 Notes per 4 Sec	
7) LED Display	2 Displays	
	Count - 3 digit / ACC - 5 digit	
8) Hopper Capacity (Notes)	Approx. 200	
9) Document Feed Mechanism	Vacuum Type	

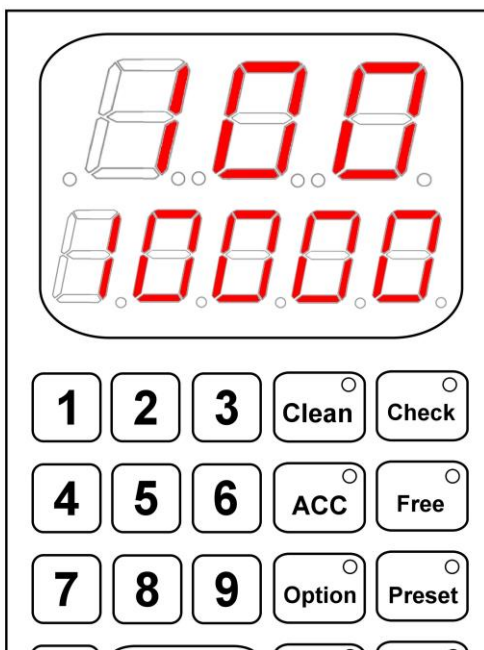

※Options

	TC-5500 (Desktop)	TC-5500S (Floor Stand)
ED- External Display	Option	Option
OK- Band Stamping Device	Option	Option
UV- UV-Detection Device	Option	Option

- Specifications are subject to change without notice.

§ FUNCTION OF THE BANKNOTE COUNTER

※ The Control Panel & Function Keys

※ The  Display Number

☞ The counting result will show on the LED screen. The lower part was the accumulated number, it will show counting result when the user selects this ACC function

※ The **Check** Function Key

☞ This function is designed for counting the banknote for 100 pieces preset. The detector will alarm when the counting result is more or less than 100 pieces after the counting process.

※ The **Free** Function Key

☞ This function is designed for free of counting. So no matter what's the counting result, it will finish the counting process & open the Banknote Clipping Plate automatically.

※ The **Preset** Function Key

- ☞ This function is designed to fix the number of banknote which be counted. It will count the correct piece as you set. The preset number will be showed at the display screen of the control panel.

※ The **Manual** Function Key

- ☞ This function is designed for human hand operation. Users have to push the function key to make it work.

※ The **ACC & Clean** Function Key

- ☞ This ACC function is designed for accumulating the total notes counted and it should be effective when ACC selected. Clean Key is for the deleting of counting result in present process and it should be effective when ACC selected.

※ The ***** Function Key

- ☞ This function key is designed for UV-Detection. Select this function then this machine can detect counterfeit note. There are 8 different UV band of sensibility for you to select.

§ HOW TO OPERATE THE BANKNOTE COUNTER

※ The **Check** Function:

- ☞ Step 1: Turn on the power switch and the machine will come into the status of Check Mode automatically. The buzzer will alarm and open the banknote holder. The LED display will show the number of “0” for starting the counting processing.
- ☞ Step 2: Putting the banknotes into the banknote holder and forwarding the banknote to touch the starting sensor.
- ☞ Step 3: The machine will count automatically and the counting result will be showed on the LED display.
- ☞ Step 4: The banknote holder will release automatically if the counting number is correct (100).
- ☞ Step 5: The buzzer will alarm if the number is less or more than 100. That means ERROR and the banknote holder will not release. The user should press the button of **Reset** for resetting and release the banknote holder.

※ The **Free** Function:

- ☞ Step 1: Press the button of **Free** to select this function then the buzzer will alarm with the opening of banknote holder. The machine is ready for using now.
- ☞ Step 2: The maximum banknote capacity approx. 200 pieces and you can count in one time. Putting the banknotes into the banknote holder and forwarding the banknote to touch the starting sensor.
- ☞ Step 3: The machine will counting automatically and showed on the LED.
- ☞ Step 4: The banknote holder will release after this counting process.

※ The **Preset** Function :

- ☞ Step 1: Press the button of **Preset** to select this function then the buzzer will alarm with the opening of banknote holder. The machine is ready for using now (The LED display will show the number of “0” for starting the counting processing).
- ☞ Step 2: Select the preset number that you need and this preset number will be showed on the LED display.

- ☞ Step 3: Putting the banknotes into the banknote holder and forwarding the banknote to touch the starting sensor.
- ☞ Step 4: The machine will count automatically. The counting result should be correct as user preset on the LED display.
- ☞ Step 5: The banknote holder will release automatically (wait about 3 sec) after this counting process if this operation is correct.
- ☞ Step 6: The buzzer will alarm if the counting number is less than the preset number. That means ERROR and the banknote holder will not release. The user should press the button of **Reset** for resetting banknote holder.

※ The **Manual** Function :

- ☞ Step 1: Press the button of **Manual** to select this function then the buzzer will alarm with the opening of banknote holder. The machine is ready for using now
- ☞ Step 2: Putting the banknotes into the banknote holder and forwarding the banknote. It will not count automatically, you have to press one more time then the function of starting sensor will be released.
- ☞ Step 3: Press this button again for starting the counting process.
- ☞ Step 4: the counting number will be showed on the LED display after this process.

※ The **ACC & Clean** Function :

- ☞ Step 1: Press the button of **Check**, **Free**, **Preset** or **Manual** to select the counting mode.
- ☞ Step 2: Re-press the **ACC** button after the counting mode selected. (The lower part of LED display will show the number of "0" for starting the counting processing.) It will also show the accumulating number in the LED.
- ☞ Step 3: The ACC feature is using automatically if the counting process is correct. It will not operate if the counting process is incorrect. The **Clean** key is used to delete the present counting result if the user doesn't want it to be added to the ACC.
- ☞ Step 4: Press again for releasing ACC.

※ The **Self-Diagnosis Test** Function :

Function: This function is designed for checking the system's: 1) Vacuum Pressure, 2) LED display, 3) Spindle Sets, 4) Counter Sets, 5) Motors banknote counting and feeding process.

☞ Step 1: User need to block the holes of Spindle Sets by adhesive plastic tape. And selecting the function key of **0** after power on. The Self-Diagnosis Test will operate automatically. User can push the same key again to turn off this function.

☞ Step 2: During testing mode, user can check by following five parts:

- 1) **The Vacuum Pressure:** For counting banknotes' air pressure can not be lesser than 480 cmHg. If lesser than this data, then this machine probably will loose air pressure. User need to check the vacuum system included: Vacuum Pump, Pipe System and Filters. Most of time the operator just needs to clean the filters of Pump (E010) and Suction Head (A002.1) only.
- 2) **The LED Displays:** The LED's numbers will show number from 1 to 999 alternately. If the numbers can't show properly then replace a new one to correct it.
- 3) **The Spindle Sets:** It can be swirled by the motors and starting vacuum suction counting method.
- 4) **The Counter Sets:** User need block the hole of Spindle Sets by adhesive plastic tape. Then can see the LED's numbers will show number from 1 to 999. It means Counter Sets is operated normally.
- 5) **The Motors:** It can detect Motor1 & Banknote Holder is working or not; Motor 2 & Spindle Sets working or not.

§ THE OPTIONAL FEATURE

※ The Stamping Function :

Function: This function is designed for checking the batched banknote of 100 pieces.

It will punch a stamping mark (OK) on first banknote if the number of banknote is exactly 100 pieces.

- ☞ Step 1: Select the function key of **Option** and the function small red light will turn on. That means stamping function now is ready.
- ☞ Step 2: In the same process as Check mode (Please see the previous explanation). The stamping mark will be punched if the process of counting number is 100 pieces. Otherwise, it would not do anything.
- ☞ Step 3: Release this stamping function, please press the button again and the small red light will turn off. That means this stamping function is canceled.

※ The External Display:

Function: This function is designed to check the counting result in the remote display.

The wire of remote display can be more than 3~6m. It is the helpful tool for customer to monitor the counting result.

※ The **UV-Detection** Function :

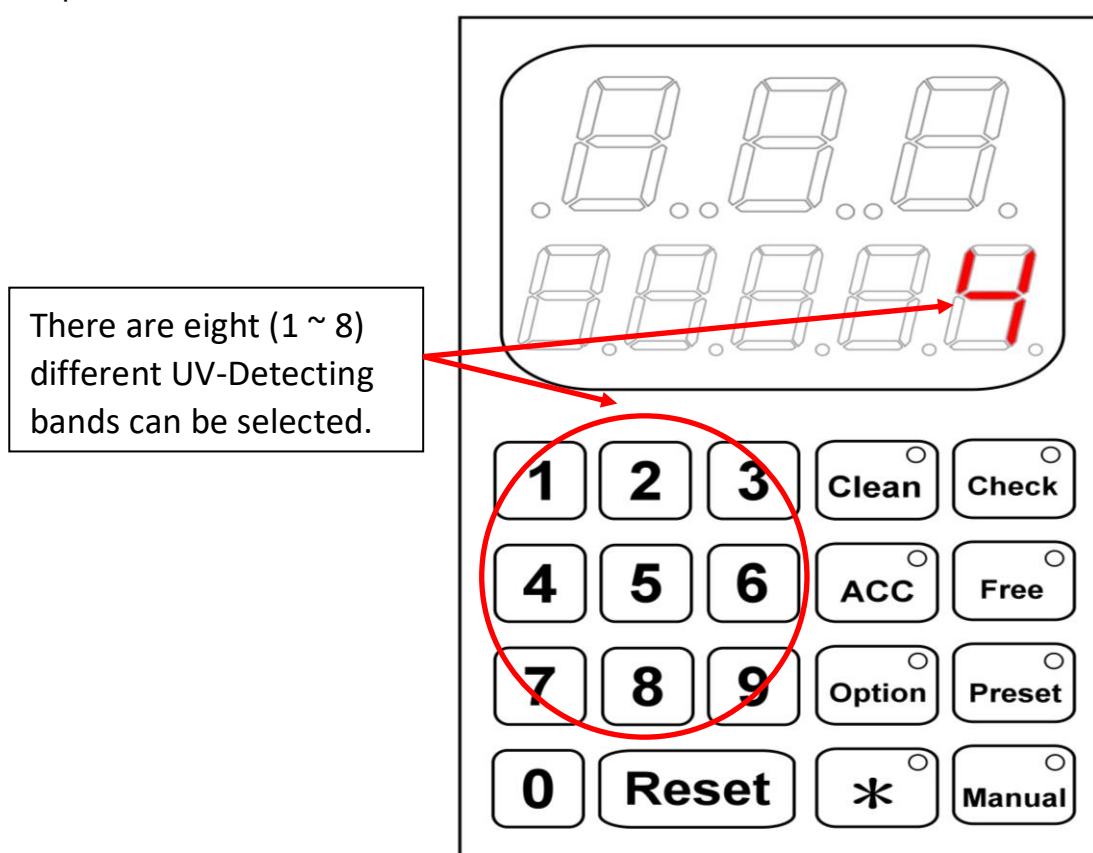

Function: This function is designed for detecting the counterfeit banknote. It can be used with the feature of Check; Free; Preset, Manual Mode and ACC feature together.

- ☞ This is simply started by push the button of  before counting process.

§ How to Use the Feature of UV-Detection

The vast majority of the world's bank notes are printed a high quality, linen-based paper, which has low fluorescence characteristics. Because the majority if counterfeit notes are printed on normal quality papers, which have been bleached and therefore fluoresce, UV detection is normally the most useful method of helping to find forged bills at the speed at which a currency counter operate. This function is designed for checking suspect counterfeit note during counting process.

P.S: Verify function can work with other counting mode: Check, Free, Batch, Manual, Stamp or ADD.

- ☞ Step 1: Turn on the machine and select the UV-Detection feature by push the key of  . The UV-detection band will be made on the band 4 automatically and user can count and test the UV-feature by genuine notes and counterfeit notes.
- ☞ Step 2: Then user can select the band by push the Number Key 1, 2, 3, ...,8. The most sensibility program was No. 1; and consequently, the most insensibility was program was No. 8.

- ☞ Step 3: If the perfectly band, for example band 1 can count genuine note and catch the counterfeit note perfectly then you can use this band for this particular note. Otherwise you must change the band to 2 ... 8. (That means the user has eight bands to find the best suitable band for each particular note.)

Note:

Following information was for Technicians Only. Please check the part of previous PC board & UV board graphic chart together.

If this machine can't find out the counterfeit note or miss detect in geniuses banknote. And user also can't find out the suitable sensitivity in 8 different sensibility levels from keypad. Please inform your service engineer to do in following countermeasure.

- ☞ Step : When technician count this bundle of note, please adjust VR3 at the same time. Turn clockwise (CCW) make the UV sensitivity higher ; turn counter clockwise (CW) to low down the UV sensitivity. User can see the change of parameter in the display after they adjust VR3.

Adjust the VR3 (Voltage Resistant) to change the voltage for suitable UV sensitivity.

1. Clockwise for a higher sensitivity
2. Counter Clockwise for a lower sensitivity.

§ PRECAUTIONS

- (1) Please check your AC Voltage; it should be the same as the Voltage specification showed on the back sticker of our Banknote Counting Machine.
- (2) Disconnect the AC cord and inform the qualified engineers for repairing our banknote counter if there is any technical trouble or damage on our machine.
- (3) Do not use the system in places, which are extremely hot, cold, dusty or humid.
- (4) When you are not going to use the system for a long period of time, please disconnect the AC cord.
- (5) If the AC cord is broken or damaged, or if the wires are exposed, contact your local agent to replaced or repaired.

§ REGULAR MAINTENANCE

☞ To clean the cabinet

Use a soft cloth lightly moistened with mild detergent solution. Do not use strong solvents, such as alcohol, benzene or thinner.

☞ Regular filters cleaning

There are two different models of filters in the machine. One is the filters of compressor, which are fixed in front of inlet, and outlet of compressor. The other one is the filters of spindle which are fixed on the top of spindle.

Regular cleaning for the filters of compressor should be every 6 months once and for the filters of spindle is every two months.

§TROUBLE SHOOTING

1. No power enter into the machine

- (1) Power supply (B041) was damaged.
 - ☞ Check power supply (B041) and plug.
- (2) Fuse was damaged (Fuse is hidden in the 2-in-1 Power Switch D026).
 - ☞ Replace a new fuse.
- (3) The cable between pump and power supply was damaged.
 - ☞ Check the plug and cable
- (4) Main control board (D031) was damaged.
 - ☞ Check or replace the board.

2. Display screen shows nothing after turn on the machine

- (1) The cable of TQU-28 (B006) / TQU-32 (B026.1) / TQU-33 (B027) was damaged.
 - ☞ Check or replacement a new cable.
- (2) The Front display board (B005.2) / Rear display board (B024.2) was damaged.
 - ☞ Check or replacement the board.
- (3) Main control board (D031) was damaged.
 - ☞ Check or replace the board.

3. The machine didn't function in the process of counting.

- (1) Micro switch (C028) was damaged.
 - ☞ Adjust it or replace a new one.
- (2) Micro switch set (B013) was damaged.
 - ☞ Adjust it or replace a new one.
- (3) Main control board (D031) was damaged.
 - ☞ Check or replace the board.
- (4) Proximity sensor set (A034) was damaged.
 - ☞ Adjust it or replace a new one.
- (5) PU Belt (A027.1) was loosed or broken.
 - ☞ Replace a new one.
- (6) The hole of spindles (A003 / A009) was jam.
 - ☞ Using air compressor to blow out the dust from the spindle filter mesh and clean suction hole; replace a new spindle filter mesh.

(7) Pump (E001) stuck.

- ☞ Turn off the machine, and use screw driver to troll the pump's fan.
- ☞ If it still stuck, take off the pump's cup and swirl the pump's fan by tools.

4. Pump does not run or lack of pressure.

(1) Pump (E001) stuck.

- ☞ Turn off the machine, and use screw driver to troll the pump's fan.
- ☞ If it still stuck, take off the pump's cup and swirl the pump's fan by tools.

(2) There were too much dust blocked the spindle filter (A002.1).

- ☞ Using air compressor to blow out the dust from the filter (A002.1); replace a new filter.

(3) Pump filter mesh (E010) blocked.

- ☞ Clean filter or replace a new filter.

(4) Fitting (A023) much dust blocked

- ☞ Clean the fitting.

5. Suction head does not move or move too slow

(1) PU Belt (A027.1) was loosed or broken.

- ☞ Replace a new one..

(2) Pump (E001) stuck.

- ☞ Turn off the machine, and use screw driver to troll the pump's fan.
- ☞ If it still stuck, take off the pump's cup and swirl the pump's fan by tools.

(3) Lack of power voltage.

- ☞ Check your electric voltage was match to our machine.
- ☞ Check power supply (B041).

6. Membrane keyboard's function key can't work

(1) Membrane keyboard (B003) was damaged.

- ☞ Replace a new membrane keyboard.

(2) Data cable TQU-28 (B006) was damaged.

- ☞ Check or replacement a new cable.

(3) Main control board (D031) was damaged.

- ☞ Check or replace the board.

7. Inaccuracy in counting process

(1) Counter Set (A035) didn't in a perfect adjustment condition.

- ☞ **Micro adjustment:** adjust counter set screw in counter clock wise (CCW) for lower sensitivity to resolve “more counting” problem or clock wise for higher sensitivity to resolve “miss counting”.

Adjust Counter Set VR503 (Voltage Resistant) to change the voltage for suitable sensitivity of pressure sensor.

1. Counter Clockwise for a lower sensitivity resolve “more counting” problem.
2. Clockwise for a higher sensitivity resolve “miss counting”.

- ☞ **Macro adjustment:** adjust counter set screw (A024) in counter clock wise for quarter circle or less. (Use the oscilloscope or replace a counter)

(2) Fitting (A023) was much dust blocked.

- ☞ Clean the fitting.

(3) There were too much dust blocked the spindle filter (A002.1).

- ☞ Using air compressor to blow out the dust from the filter (A002.1); replace a new filter.

(4) Lack of power voltage.

- ☞ Check your electric voltage was match to our machine.
- ☞ Check power supply (B041).

(5) Banknote lifting spring (Small extension spring C006) was loosed.

- ☞ Replace a new banknote lifting spring

(6) The incorrect distance between suction head and banknote blocker (B012).

- ☞ Adjust the distance between suction head and banknote blocker.
 - a. Switch off the power, the distance from the position of banknote blocker right side edge to banknote holder edge is $2.5 \pm 0.5\text{mm}$.
 - b. Switch on the power, the distance from the position of banknote blocker left size edge to banknote holder edge is $1.5 \pm 0.5\text{mm}$.
 - c. Switch off the power; main roller spindle set face to banknote holder. The distance from main roller spindle set hole edge to banknote blocker right edge is 15~16mm.

- d. Check the air blow pipe position should be between its second hole and the banknote holder.
- e. Check the banknote flipping plate position. To keep away from the main roller

(7) The incorrect air blowing direction.

- ☞ Adjust blowing pipe to blow up at least 1 to 5 banknotes.
- a. Putting the bundle of banknotes into banknote holder and forwarding it the limit to touch the starting sensor set. Turn off the power and the banknote holder will clip the banknote automatically.
- b. Pull up the **J39** socket on main board and connect direct supply power to vacuum pump. The pump will start running now.
- c. Getting loose the screw of center shaft by screw driver and fixing the screw by a wrench then do micro adjustment on the air pressure. The Center shaft unit should 90~95 degree with banknote holder.

8. Banknote holder does not open after turn on power.

- (1) Micro switch (C028) was damaged.
 - ☞ Adjust it or replace a new one.
- (2) Main control board (D031) was damaged.
 - ☞ Check or replace the board.
- (3) Extension spring (C007) was loosed.
 - ☞ Replace a new spring
- (4) L Plate (C011 / C012) was damaged.
 - ☞ Replace a new plate.
- (5) Pulley (C045) was loosed.
 - ☞ Check and adjust it.

9. The UV detecting function fail to catch counterfeit

- (1) User didn't turn on UV function.
 - ☞ Please turn on this function by press  function key. (Wait about 60sec)
- (2) The UV tube was too obscure or broken
 - ☞ Replace a new one.
- (3) Receiving sensor didn't in a perfect position.
 - ☞ Adjust the position of receiving sensor by well train professional engineers.
- (4) The current UV detecting level is not sensitivity enough to catch counterfeit.
 - ☞ User can select suitable sensitivity from 1 ~ 8 by push the Numeric Key 1 , 2, 3, ...,8 to catch this counterfeit note.
 - ☞ Adjust variable resistance at the main board.
- (5) The geniuses note had blur of fluorescence, so it assumed as fake note.
 - ☞ ☐ Pick out the strength notes and continuous counting process.
 - ☞
